**Notes:**

1. GND is the symbol for signal and supply (power) common for the QSFP+ module. All are common within the QSFP+ module and all module voltages are referenced to this potential unless otherwise noted. Connect these directly to the host board signal-common ground plane.
2. Vcc Rx, Vcc1 and Vcc Tx are the receiver and transmitter power supplies and shall be applied concurrently.

**VIII. Recommended Boot-up Sequence**

1. Host asserts LPMODE input.
2. Host powers up module and module will be held in low power mode.
3. Host brings up PHY/MAC/PCS and makes sure RF signal is transmitted towards module (Comment: RF signal can be offered anywhere during boot-up.)
4. (Optional) Host checks Initialization Complete Flag (byte 06 bit 0). When "1" is read, module enters low power mode.
5. Host de-asserts LPMODE input and writes "1" to High\_Power\_Class\_En bit (byte 93 bit 2), the module will enter high power mode.
6. Host delay t\_init (2s).
7. Host checks Initialization Complete Flag (byte 06 bit 0). After entering high power mode, this bit will be "1" and cleared after read. The typical timing is 5s and longest timing under extreme conditions can be up to 60s. If no "1" is read, the boot-up has failed.
8. Host reads interrupt flags (A0.02-0E including Data\_Not\_Ready flag and all of the interrupt flags) to clear IntL output during initialization.

**Note:**

1. The requirement of SFF-8636 v1.9 and higher versions is ignored and the module will boot up in high power mode regardless of power consumption.
