

1000BASE-BX SFP 1550nmTX/1310nmRX 10km DOM Transceiver

SFP-GE-10-SM1550-BIDI-LL

Application

- Switch to Switch Interface
- Fast Ethernet
- Switched Backplane Applications
- Router/Server Interface
- Other Optical Links

Features

- Operating data rate Up to 1.25Gb/s
- Two types:
 - A:1310nm FP transmitter /1550nm receiver
 - B:1550nm DFB transmitter/1310nm receiver
- Up to 10km on 9/125 μ m SMF
- Hot-pluggable SFP footprint
- BIDI LC/UPC type pluggable optical interface
- Low power dissipation
- Metal enclosure, for lower EMI
- RoHS compliant and lead-free
- Support Digital Diagnostic Monitor interface
- Single +3.3V power supply
- Case operating temperature:
 - Commercial: 0° C ~ 70° C
 - Extended: -20° C ~ 85° C
 - Industrial: -40° C ~ 85° C
- Compliant with SFP MSA Specification
- Compliant with SFF-8472
- Compliant with IEEE 802.3z

Description

Longline SFP-GE-10-SM1550-BIDI-LLSFP transceiver is compatible with the Small Form Factor Pluggable Multi-Sourcing Agreement (MSA). The transceiver consists of five sections: the LD driver, the limiting amplifier, the digital diagnostic monitor, the 1310 nm FP laser (the 1550nm DFB laser) and the PIN/TIA. The module data link up to 10km in 9/125um Single-mode fiber.

This transceiver meets the Small Form Pluggable (SFP) industry standard package utilizing an integral LC-Bi-directional optical interface connector. An enhanced Digital Diagnostic Monitoring Interface compliant with SFF-8472 has been incorporated into the transceiver. It allows real time access to the transceiver operating parameters such as transceiver temperature, laser bias current, transmitted optical power, received optical power and transceiver supply voltage by reading a built-in memory with I²C interface.

The optical output can be disabled by a LVTTTL logic high-level input of TX Disable, and the system also can disable the module via I²C. TX Fault is provided to indicate that degradation of the laser. Loss of signal (LOS) output is provided to indicate the loss of an input optical signal of receiver or the link status with partner. The system can also get the LOS (or Link)/Disable/Fault information via I²C register access.

20	V_{EET}	Transmitter Ground (Common with Receiver Ground)	1

Notes:

1. Circuit ground is internally isolated from chassis ground.
2. TX Fault is an open drain output, which should be pulled up with 4.7K – 10K Ω resistor on the host board. Pull up voltage between 2.0V to $V_{ccT}/R+0.3V$. When high, output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to < 0.8V. When sensing an improper power level in the laser driver, the SFP sets this signal high and turns off the laser. TX-FAULT can be reset with the TX-DISABLE line. The signal is in LVTTTL level.
3. TX disable is an input that is used to shut down the transmitter optical output. It is pulled up within the module with 4.7K – 10K Ω resistor. Its states are: Low (0 – 0.8V): Transmitter on; (>0.8, < 2.0V): Undefined; High (2.0V to $V_{ccT}/R+0.3V$): Transmitter Disabled; Open: Transmitter Disabled. The TX-DISABLE signal is high (LVTTTL logic "1") to turn off the laser output. The laser will turn on when TX-DISABLE is low (LVTTTL logic "0").
4. Should be pulled up with 4.7K - 10K Ω on host board to a voltage between 2.0V to $V_{ccT}/R+0.3V$. MOD_DEF (0) pulls line low to indicate module is plugged in.
5. LOS (Loss of Signal) is an open collector/drain output, which should be pulled up with 4.7K – 10K Ω resistor. Pull up voltage between 2.0V to $V_{ccT}/R+0.3V$. When high, this output indicates the received optical power is below the worst-case receiver sensitivity (as defined by the standard in use). Low indicates normal operation. In the low state, the output will be pulled to < 0.8V. The RX-LOS is high (LVTTTL logic "1") when there is no incoming light from the companion transceiver. This signal is normally used by the system for the diagnostic purpose. The signal is operated in LVTTTL level.
